Complete Network Management Solutions

Australia-Wide Genisyst Managed MPLS VPN Service

Genisyst is a specialist provider of MPLS VPNs. With a managed MPLS VPN service customers receive a private-IP network with high quality, secure, any-to-any connectivity. This service:

- Is based on the Cisco Multi Protocol Label Switching (MPLS) Virtual Routing Fabric (VRF).
- Provides Private-IP connections. This type of connection ensures protection from the internet.
- May have site connections implemented with multiple connection types, ethernet, wireless ethernet, ADSL, ADSL2, SHDSL, 3G mobile broadband.

- Provides site-to-site transport of flat-rate data (excluding mobile broadband connections).
- Genisyst has sixteen years experience of business network service provision and ten years experience of MPLS VPN provision, with multiple VPN customers and VPNs with up to a hundred sites.

Working with a managed services provider like Genisyst can help customers gain competitive advantage by adopting new technologies with a fixed cost and less risk. For example, sites requiring a fail-safe connection might be implemented with an ADSL2 connection with a 3G mobile broadband automatic fail-over backup connection.

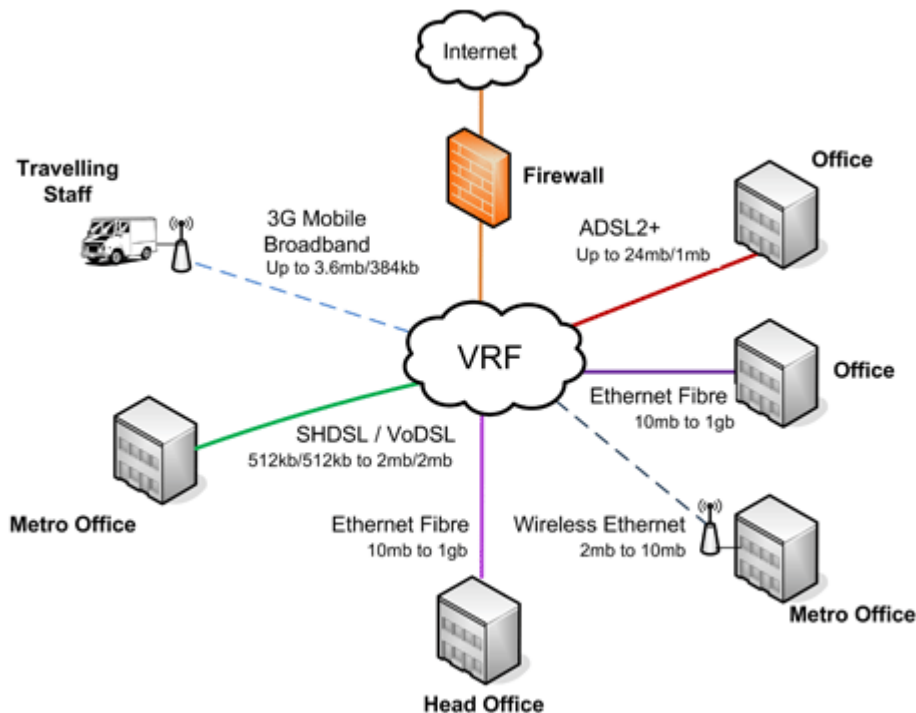

Figure 1: The Genisyst managed MPLS VPN service is available Australia-wide. A schematic representation of an MPLS VPN is shown here.

More information on MPLS is at the Cisco website, www.cisco.com/go/mpls
